1. Introduction

This document describes the Astrocast's "Remote Ground Station Base" (RGSB). The Remote Ground Station Base (RGSB) constitutes a virtual **transceiver** and a virtual **rotator controller** with interlocking facilities. The current implementation instantiates Command and Control for

- One VHF/UHF transceiver²
- One VHF/UHF rotator controller AZ/EL
- One S-Band transceiver
- One S-Band rotator controller AZ/EL

The entity for the interlocking is either the VHF/UHF transceiver and VHF/UHF antenna rotator or the S-Band transceiver and S-Band antenna rotator as a compound unit. If the VHF/UHF transceiver consists of separate Uplink und Downlink Transceivers, both belong to the VHF/UHF entity.

This solution encapsulates transceivers and rotators by providing virtual transceivers and rotators.

The entries in the configuration file named "GroundStation.exe.config", which can be altered without recompiling the project, select the concrete transceiver and antenna rotator. After altering a transceiver or a rotator, a restart of the program "GroundStation.exe" is necessary. A list in the appendix shows all available concrete transceivers and rotators.

The "GroundStationTransceiverController" serves as a simple test environment and permits activation of all commands on a command line. A graphical user interface is not part of this project.

GroundStationTransceiverController and GroundStation communicate via an EGSE router.

This document summarizes all available commands and responses, which closely follow the Hamlib definition.

For test purposes a "GroundStation.exe" is running at HB9HSLU via the EPFL EGSE router.

2. Functionality

Full remote control via the Electrical Ground Support Router (EGSE) infrastructure of up to three transceivers and up to two AZ/EL antenna rotators is required. This control software supports all common brands of ham radio transceivers and antenna controllers. The caller gets a response to issued commands. Depending on the type of radio, the scope of Computer Aided Tuning (CAT) is different. ³ The aim is to control all commands and responses that are possible for each specific type of radio. Changing a radio or a radio interface (RS-232, USB) requires a restart of the program at the premises of the ground station.

Commands for Locking / Unlocking (reservation of equipment)

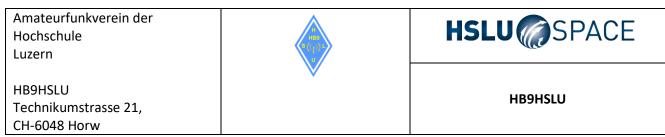

Relating to the interlock concept there are two units, a VHF/UHF unit and an S-Band unit. Each of the unit is in one of the states *free* (green) or *occupied* (red). It is therefore possible to operate VHF/UHF and S-Band independently, e.g. for student's project work. The current state is graphically displayed at the groundstation. Remote station can check the current state. It is therefore necessary to request (and release) access to the equipment.

Commands to get access to the equipment (reservation of equipment) 4

"requestVHFUHF"
"releaseVFUHF"
"requestSband"
"releaseSband"
"getReservationState"

TABLE 1 COMMANDS FOR RESERVATION OF EQUIPMENT

⁴ All commands are case sensitive.

³ The original HAMLIB documentation lists restrictions for some brands of equipment. There are no restrictions known for the Kenwood TS-2000 and many others brands.

3. Commands and Parameters for transceivers

Commands and parameters are according to the following definition.

- Command <u>short name</u> (usually a single letter) is followed by the <u>long name</u> which is followed by any variable names (parameters).
- Some short commands are noted as hexadecimal digits due to the limitation of upper and lower case letters available. Use the associated long command name instead.
- While a comma is used to separate variable names in this document, they are not part of the command syntax used by rigctl. Use a space to separate values.
- In the case of "set" commands the variable name is replaced by the value in the description.
- Commands in green colour are often used basic commands.
- This list contains only a selection of commands in order to keep this description short. The HAMLIB documentation lists all commands.
- Capitalized letters are set commands. Lower case letters are get commands.

Short name, long name parameter(s)	comment
F, set_freq Frequency	Set Frequency, in Hertz.
f, get_freq	Get Frequency, in Hertz.

M, set_mode Mode, Passband	 Set Mode to one of: USB, LSB, CW, CWR, RTTY, RTTYR, AM, FM, WFM, Set Passband frequency in Hertz, or 0 for the Hamlib backend default Passing a "?" (query) as the first argument instead of Mode will return a space separated list of radio backend supported Modes. Use this to determine the supported Modes of a given radio backend.
m, get_mode	Returns Mode as a string from set_mode above and Passband frequency in Hertz.

V, set_vfo VFO	Set VFO to one of: VFOA, VFOB,
v, get_vfo	Get current VFO.

Amateurfunkverein der Hochschule Luzern	HSLU SPACE
HB9HSLU Technikumstrasse 21, CH-6048 Horw	HB9HSLU

Lucerne University of Applied Sciences and Arts	Issue:	0	Revision:	92
HOCHSCHULE LUZERN Technik & Architektur	Date: Page:	12	15-AUG-2018 of	26
Institut für Elektrotechnik				

T, set_ptt PTT	Set PTT to one of: 0 (RX), 1 (TX), 2 (TX mic), 3 (TX data).
t, get_ptt	Get PTT status.

I, set_split_freq Tx Frequency	Set TX Frequency, in Hertz for "split" frequency operation.
i, get_split_freq	Get TX Frequency, in Hertz for "split" frequency operation.

N, set_ts Tuning Step	Set Tuning Step, in Hertz.
n, get_ts	Get Tuning Step, in Hertz.

U, set_func Func, Func Status	 Set Func, Func Status. Func is one of: FAGC, NB, NR, AFC, SATMODE, Func Status argument is 1 for "activate", 0 for "deactivate. Passing a "?" (query) as the first argument instead of Func will return a space separated list of radio backend supported "set" functions. Use this to determine the supported functions of a given radio backend.
u, get_func Func	Get Func Status.

L, set_level Level, Level Value	Set Level, Level Value. Level is one of: PREAMP, ATT, AF, RF, SQL, NR, RFPOWER, MICGAIN, AGC(0:OFF, 1:SUPERFAST, 2:FAST, 3:SLOW, 4:USER, 5:MEDIUM, 6:AUTO), SWR, ALC,
I, get_level Level	Get Level Value. The Level Value can be a float or an integer.

P, set_parm Parm, Parm Value	Set Parm, Parm Value	
	Parm is one of: ANN, APO, BACKLIGHT, BEEP,	
	Passing a "?" (query) as the first argument instead of Parm	
	will return a space separated list of radio backend	
	supported "set" parameters. Use this to determine the	
	supported parameters of a given radio backend.	
p, get_parm Parm	Get Parm Value.	
	Returns Parm Value as a float or integer for the Parm passed.	
	Parm is a token from the list in set_parm above

Page: 13 of 26

*, reset Reset	Perform rig Reset.
	0 = None, 1 = Software reset, 2 = VFO reset, 4 = Memory Clear reset, 8 =
	Master reset. Since these values are defined as a bitmask in rig.h, it should be
	possible to AND these values together to do multiple resets at once, if the
	backend supports it or supports a reset action via rig control at all.

Set power On/Off/Standby <i>Power Status</i> . 0 = Power Off, 1 = Power On, 2 = Power Standby.
Get power On/Off/Standby <i>Power Status</i> as in set_powerstat above.
j

_, get_info	_ is underscore	Get misc information about the rig		
1, dump_caps	backend knows abou This command will pr a fixed length array! F	Not a real rig remote command, it just dumps capabilities, i.e. what the backend knows about this model, and what it can do. This command will produce many lines of output so be very careful if using a fixed length array! For example, running this command against the Dummy backend results in over 5 kB of text output.

5. Commands and Parameters for rotators

Commands and parameters are according to the following definition.

- Command short name is followed by the long name which is followed by any variable names.
- While a comma is used to separate variable names in this document, they are not part of the command syntax used by rotctl. Use a space to separate values.
- In the case of "set" commands the variable name is replaced by the value in the description.
- In the case of "get" commands the variable name is the key name of the value returned.
- Commands in green colour are often used basic commands.
- This list contains only a selection of commands in order to keep this description short. The HAMLIB documentation lists all commands.
- Capitalized letters are setters. Lower case letters are getters.

P, set_pos Azimuth, Elevation	Set position: Azimuth and Elevation, double precision floating
p, get_pos	Get position: Azimuth and Elevation double precision floating

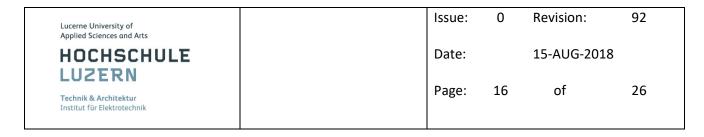

M, move Direction, Speed	•	Move the rotator in a specific direction at the given rate.
	•	Values are integers where Direction is defined as 2 = Up, 4 = Down, 8 = Left,
		and 16 = Right. Speed is an integer between 1 and 100.
	•	Not all backends that implement the move command use the Speed ⁷ value.

S, stop	Stop the rotator.
K, park	Park the antenna.
R, reset Reset	Reset the rotator. Integer value of 1 for Reset All.
_, get_info // _ is underscore	Get misc information on the rotator. returns Model Name
w, send_cmd Cmd	Send raw command string to the rotator.

TABLE 4 DESCRIPTION OF COMMANDS FOR ROTATORS

⁷ Probably unavailable for our rotator, but unchecked

7. Configuration of Transceiver and Antennae Base

- These parameters are relevant only for ground station clients, i. e. for the location where the physical antennas, transceivers and rotators are located.
- It deals with the physical connections of transceivers and rotators
- It deals with the concrete transceiver type.
- For a complete list see the HAMLIB documentation.

Rig contro	ol	
Short	Long form	description
form		
-m	model=id	Select radio model number. See model list (use rigctld –l)
-r	rig-file=device	Often a serial port, but could be a USB to serial adapter. Typically /dev/ttySO or COM1 , COM2 ,
-S	serial-speed=baud	Set serial speed to baud rate
-T	listen-addr=IPADDR	Use IPADDR as the listening IP address / localhost
-t	port=number	recommendation: even numbers for rig

Rot contro	Rot control			
Short	Long form	description		
form

8. Context and Architecture

HAMLIB offers an open source library for control of transceivers and rotators of almost any brand. The HAMLIB Core serves for transceivers (rigctl) or for rotators (rotctl) and is the base for remote controlling e. g. ground stations.

11. Appendix: Supported rotators

Rig #	Manufacturer	Model	Used at
1	Hamlib	Dummy	
2	Hamlib	NET rotctl	
201	Hamlib	Easycomml	
202	Hamlib	EasycommII	
204	Hamlib	EasycommIII	
301	XQ2FOD	Fodtrack	
401	Idiom Press	Rotor-EZ	
402	Idiom Press	RotorCard	
403	Hy-Gain	DCU-1/DCU-1X	
404	DF9GR	ERC	
405	Green Heron	RT-21	
501	SARtek	SARtek-1	
601	Yaesu	GS-232A	
602	Yaesu/Kenpro	GS-232	
603	Yaesu	GS-232B	
604	F1TE	GS232/F1TE Tracker	
701	WA6UFQ	PcRotor	
801	Heathkit	HD 1780 Intellirotor	
901	SPID	Rot2Prog	HB9HSLU
902	SPID	Rot1Prog	
1001	M2	RC2800	
1101	EA4TX	ARS RCI AZ&EL	
1102	EA4TX	ARS RCI AZ	
1201	AMSAT	IF-100	
1301	LA7LKA	ts7400	
1401	Celestron	NexStar	
1501	DG9OAA	Ether6 (via ethernet)	
1601	CNCTRK	CNCTRK	
1701	Prosistel	Prosistel D
